Claim Objections

Claim 6 is objected to because of the following informalities: "resister" (line 1) is misspelled.

Claim Rejections - 35 USC § 112

Claims 4, 13 and 14 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The system of claim 4 can not depending on method of claim 2 as presently recited in claim 4. See Ex Parte Lyell 17USPQ 2d 1548.

Claims 13 and 14 are similarly rejected as claim 4.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-17 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-13 of U.S. Patent No. 6,424,190 and claims 1-17 of U.S Patent No. 6,597,216. Although the conflicting claims

are not identical, they are not patentably distinct from each other because the prior applications claim an apparatus and method of a transition delay matching circuit including a divided clock signal input section, a clock buffer section, an amplitude adjusting section limits the amplitude of an output signal, first and second clock signals of the plurality of clock signal are 180° out of phase with respect to each other, the amplitude adjusting section includes first and second resistors, or first and second frequency dividing means, amplitude limiting means, a resistor, wherein the instant application is now claiming a method which includes all of the elements and method steps of the prior claims (for example: a divided clock signal, a clock buffer section, limits the amplitude of an output signal, a resistor, first and second clock signals of the plurality of the clock signals are 180° out of phase with respect to each other, first and second resistors).
